              Shivam Ganwani(01FB16ECS365)

Description:
        We have created a website that is used to rent vintage
cars. Using this site, we can book the car of our choice. Also, we
can register at the site. The site includes an introductory page, a
homepage, an 'about us' page, a contact page, an 'FAQ' page, the
booking page, the client information page, a registration page, and
finally, a 'Thank you' page.
        We have used all the important technologies that have been
taught to us during the time of this course. They include HTML, CSS,
JavaScript, DOM, PHP and MySQL.
        Our forms include input validation through JavaScript.
Also, we have used CSS to increase the aesthetic value of our
website. We have used PHP and MySQL for backend programming and all
the details that the client enters in the registration form gets
saved in the database that we created for this purpose. We have also
used accordion in JavaScript to display information only when the
client requests for it. We have added special features of JavaScript
where the displayed calendar always starts from the current date. We
have used a wide range of styles from CSS and CSS3 to make the page
look better and get the desired look. We created a database called
'registration' to store the values that the user entered into our
registration form.
        This is a brief overview of our project.
THANK YOU.
